Type Text Text objects can be placed on curves, surfaces, and other objects. A text object is a point, line, or polyline. Other variations are available. Text is available in the drawing editor. When placing text, the user may select from one of the predefined text objects (such as the gutter, paragraph, or title, among others), type from the on-screen keyboard, or drag text from a file. When editing text, the user

may select text, change text properties, type, change the layout, select the options, add or delete text, or modify text. In text styles, the user may change fonts, colours, line types, line weights, and line spacing. Text styles can also be shared between objects. Text styles are modified by properties such as font name, colour, line type, line weight, line spacing, and angle. The user can also use the drawing style properties in the same way as text styles, which include: line colour, pattern fill, fill colour, spacing, and linetype. The user may edit text in two ways. Texts may be edited and dragged or moved using a selection, or typed using the on-screen keyboard. All text objects can be edited by selecting them and typing. Texts may be aligned, measured, justified, and justified selected. Alignment includes the left, right, center, and baseline options. Other options are available when aligning text, such as vertical, horizon, vertical and horizontal, and justified. Justified text is justified to the right margin, justified left, justified center, or justified baseline. When selecting justified text, the user may choose the direction of justification (left, right, center, baseline) from the Tools -> Text options menu. Justifying, aligning, and measuring text is similar to all other properties in that the user can change them by selecting text and typing. Text width may be modified by selecting and typing. Any text may be selected using the ctrl + left or ctrl + right keyboard shortcuts. To select a line of text, or some text, and move it, the user may move the text to a location, and then move it back to where it was using the Ctrl + left or Ctrl + right keyboard shortcuts. The user may also modify a selected text object by typing, or pressing keyboard shortcuts, or clicking with the mouse. Text may be scaled from the Tools -> Scale command. The user can change a1d647c40b

Category:Computer-aided design software for WindowsQ: Are these used right? Is there a reason for using two completely different names for the same term? For example, "She bought a new iPhone" should be "She bought the iPhone", because "She bought an iPhone" doesn't make sense. Another example, "The kitchen contains cups" should be "The kitchen contains cups, utensils, plates, etc." because "The kitchen contains cups" doesn't make sense. A: They are used correctly and, in fact, it's the same reason why the expression "in front of someone" has two different meanings. When "in front of someone" means "in the same place as someone," it's called an "adjacent predicate." So "in front of someone" means "in the same place as someone" but also "at the same time as someone." For example, "the kitchen is in front of the dining room" means "the kitchen is in the same place as the dining room" but also "the kitchen is open at the same time as the dining room." When "in front of someone" means "at the same time as someone," it's called an "antecedent predicate." For example, "the kitchen is in front of the dining room" means "the kitchen is open at the same time as the dining room." "She bought a new iPhone" is a sentence where "in front of" in the adjacent predicate sense makes sense. "She bought the iPhone" is a sentence where "in front of" in the antecedent predicate sense makes sense. That's the only
