## MemoQ License Key For PC

If you have a client base, or wish to translate documents on a regular basis, we may have the solution to your problem. Our software will handle your bulk translations in seconds, all backed by a powerful and easy-to-use toolkit. view: 694 downloads

Memory<sup>2</sup>OLPP v.2.3.1.2 Memory<sup>2</sup>OLPP enables the user to store a series of translated sentences in the selected translation memory in a single "sentence bank". This allows the user to see the entire sentence bank. When new translations are added, the user can select one or more translations of the sentence(s) from the sentence bank and replace them with the new translations. This can be done for individual sentences or for all sentences of a document. The software program allows the user to store a number of sentences in a single memory bank. Once a user has created a sentence bank, they can look to it and find the sentences they use on a regular basis, such as for a web site, form letters or boiler plate text. The sentence bank is easy to navigate and search, as users can browse it in an index, sorted by word or sentence. Sentences can be found in the sentence bank by typing in a word, or by searching. The user can create a single sentence bank by typing in a translation or by browsing the sentence bank. The user can then add other sentences to the sentence bank for a particular document. The user has the ability to replace the sentences of a document that they have already translated with the new set of translations for that document. They can replace individual sentences, or the entire document. The user can choose to Replace Words, or Replace Sentences for document(s). The user can choose from a number of languages to translate to, allowing the user to search for translations from many different languages. A versatile tool for proofing, reviewing, and iterative translation The user can view and translate either the words, or the whole sentence at a time. The user can see the translation history for each document, giving the user a clear view of what was done to the document and to which translation works. This helps the user to track the changes made to the document. The user can mark the translated copy against the original copy of the document, or the original copy against the translated copy. The user can leave comments for the translators on any work in the sentence bank. The user can view the original text from which the

## MemoQ

memoQ is a comprehensive and reliable software solution aimed at professional translators who need to work on multiple projects simultaneously, yet proving just as handy for less experienced individuals that are just getting started in the field. Straight-forward and practical appearance The program features a tabbed interface, enabling users to easily switch between its main sections, specifically 'Translations', 'LiveDocs', 'Translation Memories', 'Term Bases' and 'Muses', while the 'Dashbord' allows for quick access to the 'Frequent Tasks'. In the lower panel of the main window, users can view the current projects along with the completion level, the creation date, the used languages as well as the deadline for the translation. Swiftly create, manage and translate large projects with minimal effort In order to create a new project, users can resort to the wizard as it saves them both time and effort, letting them input its name, the source and target languages, the client and subject. Optionally, users can record the version history of the translated documents and create a Language Terminal entry for the current project or connect to a content source. The next step consists of importing the documents which need translating, supporting a wide array of formats, ranging from TXT, DOC, PPT, PDF, RTF, to the more specialized formats, like TTX (generated by Trados), XLF, MBD, BAK, and countless more, meaning that regardless of users' file of choice, memoQ will be able to work with it. Moreover, users will need to create a 'Translation Memory' or pick an existing one by importing it from TMX or CSV files. Similarly, they can create a 'Term Base' or select one from other available TBX files, and they can also 'Import Terminology' from locally stored documents. When working on a translation, memoQ displays the text in segments, corresponding to a full sentence, enabling users to merge or split them according to their needs. For words found in the 'Term Base', the utility will provide the available equivalents. When complete, the text can be exported to several bilingual formats. A reliable tool for translation professionals In conclusion, memoQ is a professional application that can successfully assist translators in their work, significantly simplifying their task and allowing them to create high-end translations with a small amount of effort.
