changing graphics User interface The AutoCAD user interface has been updated in 2019. The basics of AutoCAD's user interface have remained the same; however, there are some new features available in AutoCAD 2019. Among the new features are the following. The new version has a much more intuitive design for using AutoCAD. The features have been organized into three main areas: main menu, ribbon, and the application window. You can navigate the interface to access any of the features.

When you first open AutoCAD, the block drop-down list on the main menu is populated with a predefined set of blocks that you can access by clicking on them in the order in which they appear. After you click on a block, the block list is cleared, and you can access all the blocks by simply clicking on the block name to open it. This feature is great for easy access to the blocks. The ribbon menu can be accessed by clicking on the tab that shows the menu name. The ribbon menu contains many of the built-in tools of AutoCAD.

1. Field of the Invention This invention relates to the field of robotics. More specifically, this invention relates to a method for detecting and/or correcting misalignment of the axes of two linked platforms.
2. Description of the Related Art Robots are becoming increasingly sophisticated, performing tasks once thought possible only for human operators. This has resulted in a shift in the design of robots from being one-purpose devices into multi-purpose devices. A multi-purpose robot may be built to perform a variety of tasks such as welding, spot welding, cutting and fabrication. However, as the variety of tasks a robot is capable of performing increases, the design of the robot becomes more complex and time consuming. Typically, a robot arm includes a number of linkages, each configured to perform a particular operation. For example, a robot arm designed to perform a particular welding operation may include an upper arm, a lower arm, a first shoulder linkage, a second shoulder linkage and a first elbow linkage. The lower arm, the first shoulder linkage, the second shoulder linkage and the first elbow linkage are interconnected by a first universal joint, the upper arm and the second shoulder linkage are interconnected by a second universal joint and the upper arm and the first elbow linkage are interconnected by a third universal joint. Most robots are designed to perform a specific function, such as welding, cutting or fabrication. For

example, a welding robot is designed to perform welding operations.
