In general, in a liquid crystal display device, a liquid crystal compound is mixed with a polymeric material (polymer) to form a polymer liquid crystal and is then put into a liquid crystal cell. In a liquid crystal display device of the twisted nematic (TN) mode, a liquid crystal display device of the dynamic scattering (DS) mode, and a liquid crystal display device of the super twisted nematic (STN) mode, liquid crystal molecules are orientated in one direction in a liquid crystal cell and the liquid crystal molecules in the liquid crystal cell have scattering characteristics and the light is scattered by the liquid crystal molecules. In recent years, the liquid crystal display device has been actively developed. Among various types of liquid crystal display device, a liquid crystal display device in which cholesteric liquid crystal is used is known as a liquid crystal display device which has very good viewability. For example, in the liquid crystal display device of the cholesteric liquid crystal mode, a polymer liquid crystal having a helical structure is used. The helical structure is formed by twisting liquid crystal molecules by a cholesteric liquid crystal compound. The helical structure of the polymer liquid crystal is formed in an electric field applied to the liquid crystal. The helical structure of the polymer liquid crystal has the same pitch as the
