Does anyone know what happens to a tendon after it's in place? Does it become scar tissue? Does it bleed? Is it thick or thin? That stuff would be helpful because I know that I will be cutting a piece of my psoas tendon off today, it's always been there, but I would like to know about it. I just want to make sure I keep it attached to my tailbone. Another example, would you support something with a tendon? How close does the tendon need to be? I think the process of reaching into the knee is a good example. The tendons can be either cordlike and well-defined, or distorted and haphazard. I don't think I've ever seen the second kind. Not that I have looked very carefully... It's not quite a psoas tendon. The attachments are higher than the psoas, meaning more like a gluteal aponeurosis. I haven't observed this tendon get thicker as you get older either. It's elastic and will retain the ability to grow. But the psoas tends to be thicker as you age. In regards to the thigh I'd agree with Rody. The ischial tuberosity is right at the center of the sulcus popliteus. If it's not a pain location a lot of people will treat it like the bursa and remove it. This post illustrates it pretty well. I am a bit concerned that I am going to cut my tendon down and then have to tape it back on the other side, because I am not sure how it's going to feel or where it will be. I've never messed with anything like this before.
