The biggest change for photographers is that the new Adobe Camera RAW (ACR) can be used as a RAW converter. It's also the only image browser (taken from Lightroom) that allows you to preview the image data that is stored within a PSD file. The best part of this update, though, is the new Photoshop 2023 on the Mac. It works with many of the same features as the earlier version, but adds a few features that make it easier to work with PSDs, in particular the ability to see which layers are within a PSD file and how they are arranged. PCMag's reviewers have already had a chance to try out the beta versions of this update. As you can see on this page, the comments section is available in the page preview. You can also choose to include other web-based tools, such as feedback from SmashingMagazine . One of the most common questions I get is how to turn a PSD into a web-ready HTML file. The process is actually faster than ever, thanks to the new version of Photoshop on the Mac. You can create HTML from PSDs, and you can use the export options on a Photoshop file to make it web-ready. The interface is easier, too. Photoshop CC for Mac now remembers your last-used settings for brush size, color swatches, and so on. It also lets you adjust the look of a document while it's open by using the new Darken and Lighten tools (which operate on the entire picture), and by adjusting the Lens Correction and White Balance settings. I downloaded the new version and it automatically installed. I opened a library, imported a location as a catalog,

and imported some images from an external drive. From the "Develop" tab, the tag panel is already displayed. I added a new tag in the upper right hand corner of the tag panel; the upper left hand corner of the panel became a search field. I typed the word "Camera" in the field and found my camera's location. I clicked on it and it opened the camera's metadata. I clicked on Import and from the search panel of the import window I selected my camera location. That's it!
